

Five Properties for Atthowe Works in Plainview -- the ground an ecological tenant can lift, read by what each hand rewards

Stamp: STAMP -- to be taken from the one clock at seating, never typed by counsel

Language: EN

Style: New Gauge, Field setting -- Civic (name what the reward measures) and TAME (bound every claim, say why) carried through (see [../context/GAUGE_STYLE.md](#))

Voice: Kyri

Status: Mixed -- research for understanding, with dated readings a program could later bind. The parcels, programs, and prices are real and dated; the five property types and their order are counsel's lean and stay proposed until the maintainer's word; every money move waits behind the sleeve's gates, and this page is neither investment, legal, nor tax advice

Basis: the public seed `grain-os/grain` at tip `d983995` (2026-08-26), where the works town study stands and where `plainview` and `atthowe` read zero in file names

Spine: the [works town shape](#) filled at Plainview, read now for the ground beside the plant rather than the plant

Kin: [the first works town on the Brazos](#) - [a works at the top of the Brazos](#) - [Kansas City fiber corridor](#) - [Civic Style](#) - [the Silo Technique](#) - [Simple, Lovable, Complete](#)

Room note: this study names outside towns, agencies, listings, and companies plainly, as the external-research room allows; the fund, the family, and the allocation stay in the maintainer's field, where the works town sleeve already reads them

The finding, first

The plant stays the city's, so the syndicate's ground is the ground beside public flows.

The works town study found that public money rewards a public owner, and that a syndicate's open doors at Plainview are the receipt, the reuse lease, and the retrofit contract. This page reads the real estate those three doors open onto, and finds five

kinds of older, low-priced property in and around the town that an Atthowe ecological tenant can lift: **the seed-and-grain yard, the reuse acres beside the plant, the downtown brick in the reinvestment zone, the shop yard turned fertility works, and the cold warehouse turned food hub.** Each pairs a property that prices today near land-plus-scrap with a tenant whose revenue is the good the town already wants, so the lift in net operating income is the same number as the lift in the river, the soil, or the plate.

Atthowe ecological is this tree's own name for the ethic these tenants grow under: fertility raised from plants rather than animals, water returned cleaner than it came, less drawn from the aquifer, and food and fibre a person can trace. It carries the name of the farmer whose book teaches the practice, thanked in the room kept for thanks. An *Atthowe works* is a business that earns by doing it.

Counsel's lean on order: **the yard first, the acres second, downtown third, the fertility works fourth, the food hub fifth.** The first two ride the works study's own first two laps, the receipt and the reuse lease, and the yard is the cheapest proof that the whole thesis holds. The equity target the maintainer named, a lift of ten to twelve percent or more for the limited partners, reads as reachable on the first three at the cap rates a small West Texas market trades at, under the assumptions section 1 states; on the last two it reads as a live possibility rather than a base case, because their tenants are younger businesses.

1. What a lift is, and what Civic asks of it

A commercial property is worth its income divided by a rate. *Net operating income*, NOI, is the rent a property collects in a year less the cost of running it, before debt. The *capitalization rate*, or cap rate, is the yield a buyer in that market asks of that kind of income; a nine percent cap means a buyer pays about eleven times NOI. A *syndication* is a group purchase in which a sponsor finds and runs the property and limited partners supply most of the money. Raising NOI on a property, then having an appraiser or a buyer read the higher income at the market's rate, is the whole of value-add investing, and the equity lift the limited partners see is that gain in value divided by the equity they put in.

Three readings frame every example below.

The market rate, dated. Listed commercial properties in Lubbock, the nearest metro, carried an average asking cap rate of 7.02% (listing aggregator, 2026). Texas industrial along the major corridors traded at 5.5 to 6.5% and suburban Class B apartments at 6 to

6.25% in early 2026 (a Texas brokerage's market note). A micropolitan of 20,000 trades wider than its metro, so counsel's planning assumption for Plainview is **8 to 9.5%** for older industrial and mixed-use -- an assumption rather than a reading, and the first number a local broker's opinion would replace.

What new income buys. At a 9% cap, every USD 10,000 a year of new, durable NOI reads as about USD 111,000 of value; at 8%, about USD 125,000. Equity moves with value when the property carries debt of zero, and faster than value when it carries some: with debt at half of cost, a 6% lift in value is a 12% lift in equity, and the same arithmetic runs downhill when a tenant leaves.

What an appraiser credits. Income that a signed lease and a tenant's books support. This is where the tree's own habit pays: the tenant's receipts and the property's books, kept as separate append-only ledgers a co-investor can fold on a phone, are the surface that turns a projection into a reading. Civic Style asks of the deal what it asks of a policy. The reward measures NOI, so the tenant is chosen so that its NOI is the good -- acre-feet of reuse water put to a verified use, tons of residue kept from the landfill and returned to a field, bales carrying the water they grew on, meals moved from an ecological field to a public plate.

format lift-v1

property a seed-and-grain yard ten minutes west of
Plainview -- the worked example

price_today USD 175,000 asking, under contract (listing, 2026-
08-20); USD 225,000 the prior asking

improvements roof, power, scales, gravel, fire and life-safety
-- counsel's planning band USD 250,000-350,000, unquoted

cost_all_in USD 425,000-525,000

noi_for_target about USD 50,000 a year net reads an 11% lift at a
9% cap on USD 500,000 all-in

what_that_rent_is USD 1.00 per square foot per year on 50,000 square
feet of covered storage, or about USD 4,200 a month for yard, roof, and
scales

cap_rate_assumed 8-9.5%, counsel's assumption for a micropolitan;
Lubbock's listed average 7.02% (2026) is the nearest reading

equity_lift about 11% unlevered at USD 50,000 NOI and 9%;
about 25% at 8%; about 22% with debt at half of cost and 9%; a leaving
tenant runs the same arithmetic down

verifier an appraiser with no stake, reading a signed lease
and the tenant's books; the syndicate's glass ledger is what it reads

falsifier a broker's rent opinion under USD 0.75 per square foot, or an all-in cost over USD 600,000 once the roof is bid

2. The five, read as rewards

Property type	The Atthowe tenant	What its reward measures	The public receivable	A dated example in Hale County
the seed-and-grain yard -- a former seed, chemical, or grain dealership with big sheds, scales, and a yard, sometimes a rail spur	the fibre operator: residue and hemp-straw baling and storage, then a hurd and bast line	bales in, tons out, and the water each bale grew on	erosion-control and building-infill sold on state specifications; a federal rural business guarantee for the line	4.94 acres with a seed warehouse, offices, and about 50,000 square feet of grain storage on US 70, USD 175,000 under contract (listing, 2026-08-20); 5.09 acres with a rail spur and interstate frontage north of town, sold at USD 75,000 (listing)
the reuse acres beside the plant -- irrigated cropland with a farmstead and barns within reach of the reclamation plant's land-application system	the grower: fibre hemp on reuse water, cover-crop rotations, plant-raised fertility, living mulch	acre-feet of reclaimed water put to a verified non-food use; pounds of straw per acre-foot	the Chapter 210 reuse authorization; federal conservation payments for cover crops and soil carbon amendments, offered to Hale County producers (federal agency, 2023)	52.7 acres on County Road V, sold at USD 95,000 (2025-09-04), about USD 1,800 an acre; 1,080 acres sold at USD 1.2 million (2025-05-20), about USD 1,100 an acre (listings)

Property type	The Atthowe tenant	What its reward measures	The public receivable	A dated example in Hale County
the downtown brick in the reinvestment zone -- a one- or two-story building inside the National Register district and the city's downtown TIRZ	the market: a covered market hall, an ecological grocer and kitchen, the receipts office, lofts above	occupied square feet at rents that read on a ledger; market days held	reimbursement grants for roofs, electrical, plumbing, interior, facade, and life-safety work (city, 2026); a federal 20% credit and a sellable state 25% credit on certified rehabilitation (state commission)	the 1920s eight-story hotel converted with tax incentives into 28 apartments (city, 2026-02); the district's own buildings, which the city calls old, charming, and in need of updates to open
the shop yard turned fertility works -- a metal warehouse with a shop, offices, and fenced acres on the interstate or the county road	the fertility works: biochar from plant residue, compost to the state highway specification, later blended with recovered nutrients	tons of residue in, cubic yards on the state spec out, carbon held per ton	the state highway department's compost item and its testing-assurance certification; a services contract for the plant's residual if the city's reading allows it	4.9 acres with a 60-by-60-foot metal warehouse, 3,770 square feet of office and warehouse, and a barn, sold at USD 99,900; 16.4 acres with a 7,036-square-foot hangar and a 3,264-square-foot shop, a former aerial-application business, sold at USD 375,000 (listings, undated)

Property type	The Atthowe tenant	What its reward measures	The public receivable	A dated example in Hale County
the cold warehouse turned food hub -- an older cold-storage or distribution building near the rail line or the interstate	the hub: aggregation, washing, cold chain, and a kitchen for ecological produce and grain, feeding public plates	pounds delivered to the school district, the hospital, and the university; miles from field to plate	school-meal procurement under federal and state farm-to-school programs; the state department of agriculture's local-food preference	a listing gap -- counsel read the type by role (a distribution center and a large cornmeal plant already stand here; city, 2026-02) and found zero cold-storage buildings for sale on the dated lists

Read down the fourth column and one pattern holds: **public money rewards the specification, the authorization, and the plate; private rent rewards the roof**. A syndicate that buys the roof and leases it to the business that sells on the specification holds both.

3. The seed-and-grain yard -- the fibre operator's ground

What stands. Ten minutes west of town on US 70, a former seed and chemical dealership sits on 4.94 acres with offices, a large former seed warehouse, and about 50,000 square feet of grain storage per the appraisal district, asked at USD 225,000, then at USD 175,000, and under contract as of 2026-08-20 (listing). North of town, 5.09 acres with a railroad spur and interstate access-road frontage sold at USD 75,000 (listing). The Class I main line between Lubbock and Amarillo runs through the town, as the works study named. These are the ordinary bones of a plains farm town: sheds built for seed and grain, a scale, a yard, and a spur, priced now near what the sheds would fetch as scrap.

The tenant. The fibre operator the Brazos study described, with residue first and hemp on reuse water second. The high plain's first material is the stalk residue already lying in the fields, and the Lubbock cooperative of roughly 35 to 40 family farms that grows most of the country's organic cotton sits about 45 miles down the interstate (Brazos study). A first lap bales and stores. A second lap runs a one-ton-an-hour line, which counsel's

earlier study priced at USD 1.2 to 2.5 million landed (planning range, 20260725), inside a shed that already has the roof.

The lift. Vacant to net-leased. The property earns a flat rent for roof, yard, and scales, with a modest revenue-share kicker on tons out, and the lease is as durable as the tenant's offtake letters. The worked example in section 1 says what the rent must be: about USD 50,000 a year net on a USD 500,000 all-in cost reads an eleven percent unlevered lift at a nine percent cap.

The trap, read from the deed. The US 70 listing carries a twenty-year restriction: the property may not be used for the sale or distribution of agricultural chemicals, seed, or fertilizer (listing, 2026-08-20). A bale yard and a fibre line clear that plainly. A fertility product sold from the same parcel wants counsel's reading of the word *fertilizer* before any lease, which is why the fertility works gets its own property type below. The lesson travels: dealership sites often carry a seller's non-compete, and the title read comes before the tenant.

```
format property-lift-v1
type                seed-and-grain yard
example            743 US 70, Plainview -- 4.94 ac, seed warehouse,
offices, ~50,000 sq ft grain storage (appraisal district)
price_today        USD 175,000 asking, under contract (listing, 2026-
08-20)
tenant            fibre operator -- residue and hemp-straw baling
and storage; a 1 t/h hurd and bast line in the second lap
public_receivable  state-DOT approved rolled erosion control (bast)
and building-infill hurd on a performance spec; a federal rural business
loan guarantee for the line
noi_lever          vacant -> net lease on roof, yard, scales, plus a
tons-out kicker
capital_stack      equity plus modest fixed debt on the roof; any
rural-development guarantee sits on the tenant's line rather than the
roof
verifier          an appraiser reading the lease and the operator's
ledger; a scale ticket per bale
trap              20-year deed restriction on chemicals, seed, or
fertilizer; the title read comes first
falsifier          the second season closes with the straw contract
and the offtake letter still unsigned; a rent opinion under USD 0.75/sq
ft/yr
```

4. The reuse acres beside the plant -- the grower's ground

What stands. The city's reclamation plant returns about 1.8 million gallons a day against a 3.3 million-gallon permit, beside Running Water Draw, and the sewer ordinance names a land-application site as the other home for that water (works study, 20260825).

Irrigated cropland around the town prices by the acre: 52.7 acres on County Road V sold at USD 95,000 on 2025-09-04, about USD 1,800 an acre, and 1,080 acres sold at USD 1.2 million on 2025-05-20, about USD 1,100 an acre (listings). The mayor describes the county from the air as pivot circles covering everything, with cotton, corn, sorghum, and wheat under them (city, 2026-02). The university's fee-based hemp variety trial has run at Plainview under irrigation since 2020, at about an inch a week (extension, 2020), and the Lubbock fibre trials measured dryland, six-inch, and twelve-inch seasonal water, funded by the underground water district (extension, 2022).

The tenant. The grower, under Atthowe ecological practice: fibre hemp and residue crops on reuse water, cover crops and living mulch for fertility, plant-derived amendments only. The federal conservation program's soil carbon amendment practice, code 336, pays for biochar and compost derived from plant residues, and its climate-focused round was offered to Hale County producers in 2023 (federal agency, 2023); cover crops and conservation rotations sit in the same program's incentive contracts. A grower whose books show those payments beside a reuse lease is a tenant whose revenue is public in two places.

The lift. Water is the lever. Dryland ground on this plain prices near USD 1,100 an acre and irrigated ground higher; an acre with a declared allocation of reclaimed water under a Chapter 210 Type II authorization, which covers irrigation of a non-food crop at limits a modern plant clears, is a third thing the market has few comparables for. The property's NOI is a farm lease at an irrigated rent plus a bale barn and an equipment shed. The appraiser's reading rises with the water receipt, which is the same receipt the works study's first lap produces. Counsel names the irrigated-versus-dryland cash rent spread as a gap; the county extension office publishes it.

The trap. Type II water is for non-food crops. A grower who wants food crops on reuse water needs a Type I authorization and a plant that treats to it, which is the retrofit lap rather than the first one. And the ethic reads the acres before the lease: a parcel whose recent fertility came from a feedlot's manure is ground to be made clean over several seasons, which is a cost and a story rather than a stop.

```

format property-lift-v1
type                reuse acres beside the plant
example            a pivot-irrigated parcel with a farmstead and
barns within reach of the plant's land-application system -- acres a
named gap
price_today        USD 1,100-1,800 per acre for recent Hale County
sales (listings, 2025); irrigated with a water receipt has few
comparables
tenant            the grower -- fibre hemp and residue crops on
reuse water, plant-raised fertility, living mulch
public_receivable  the Chapter 210 reuse authorization; federal
conservation payments (cover crops; code 336 soil carbon amendment,
offered in Hale County 2023)
noi_lever          dryland rent -> irrigated rent with a declared
allocation; a bale barn and shed on a net lease
capital_stack      equity and a farm-credit term loan; the water
lease with the city on the plant's own permit
verifier          the plant's signed daily reading; the bale's water
tag; an independent lab funded as load-bearing
trap              Type II covers non-food crops only; manure-fed
ground wants seasons to come clean
falsifier          the permit reading that sends the whole return to
the city's own site with zero acre-feet left to lease; a fibre-yield
floor missed two seasons running

```

5. The downtown brick -- the market's ground

What stands. The Plainview Commercial Historic District is on the National Register, roughly bounded by East 4th, Austin, East 9th, and Ash streets (register listing). The city's Tax Increment Reinvestment Zone Number One, created by ordinance in May 2018, covers the historic downtown and reimburses building owners for roofs, electrical, plumbing, interior upgrades, facades, and life-safety code work (city page; city officials, 2026-02). The streetscape the city built with bond money was unveiled in April 2026, and a carrier's grant added a downtown speaker system (regional news, 2026). The city's own precedent is the strongest reading on this page: the 1920s eight-story hotel, the seventh in its chain, worn out and closed since the late 1980s, was bought by a developer using tax incentives and converted into 28 apartments (city, 2026-02). And the works study read the commons: soccer standing, theatre standing, stage seeded, **market a gap**.

The tenant. The market. A covered market hall with a plant-forward grocer and kitchen, the syndicate's receipts office where the plant's daily reading is folded for anyone who walks in, and lofts upstairs for the people the city says it lacks housing for. The city notes that a beef storefront opened downtown on the strength of the walkability (city, 2026-02); the Atthowe reading is that the market hall opens its own door on the same street.

The lift. Vacancy to mixed use, with the equity basis cut by public capital. The state's historic preservation credit is 25% of eligible rehabilitation cost, sellable, and usable against franchise or insurance premium tax; the federal credit is 20% for income-producing historic buildings; together they have covered about 45% of eligible cost on Texas projects that used both (state commission). Since 2015, 63 federal-credit projects in Texas have been certified with USD 932.5 million in credit-eligible expenses, and about half used both credits (state commission, legislative page, undated). Add the TIRZ reimbursement on the roof and the systems, and the equity that has to earn the lift is a fraction of the cost the appraiser values. This is why downtown reads as reachable on the target even at a modest rent: the denominator is small on purpose.

The trap. Credits reward certified rehabilitation, which means the state commission and the national park service review the work against the federal rehabilitation standards, and the credit arrives after an audited cost report rather than before the roof. A syndicate that needs the credit to close the equity has the timing backwards; the credit is the second return, and the rent is the first.

format property-lift-v1

type downtown brick in the reinvestment zone

example a one- or two-story contributing building inside the National Register district and TIRZ #1 -- address a named gap

price_today a named gap; downtown parcels sold at USD 65,000-250,000 in 2011-2013 (listings), current asking to verify

tenant the market hall, an ecological grocer and kitchen, the receipts office, lofts above

public_receivable TIRZ reimbursement (roofs, electrical, plumbing, interior, facade, life-safety); federal 20% + sellable state 25% on certified rehabilitation

noi_lever vacant -> ground-floor retail and market rents plus upstairs residential; the market's stall fees on a ledger

capital_stack equity, a small fixed loan, the credits sold after the audited cost report, the TIRZ grant on completion

verifier the state commission's certification; the city's
grant inspection; the market's stall ledger
trap credits land after the work, on certified scope
only; a grant forfeits when work starts before the notice to proceed
falsifier the TIRZ fund thins or closes before purchase; the
building reads non-contributing on the district map

6. The shop yard turned fertility works -- the residue's ground

What stands. The ordinary metal-building property of the interstate edge: 4.9 acres with a 60-by-60-foot warehouse with two overhead doors, 3,770 square feet of office and warehouse, a smaller office, and a barn, sold at USD 99,900 (listing, undated); 16.4 acres with a 7,036-square-foot hangar and a 3,264-square-foot shop, a former aerial-application business, sold at USD 375,000 (listing, undated). The plant produces 2,306 tons of sludge a year with its home a named gap (works study). Gins and elevators around the county produce gin trash and stalk residue by the thousands of tons a season, and the organic cooperative's gins produce the cleanest of it. The state highway department buys compost on its own specification item, which asks for a testing-assurance certification, and has used compost in more than half of its districts since the early 2000s (federal environmental agency case study, 2003; state specification, 2019 edition). The state's compost rules live in Chapter 332 of its administrative code (state environmental agency).

The tenant. The fertility works: a pyrolysis unit turning plant residue into biochar, a compost pad turning gin trash and hurd fines into compost graded to the highway specification, and, in a later lap, a blending line for the nutrients the plant's retrofit would recover. This is the materials thread from the earlier studies -- residue to biochar, nutrient precipitates to slow-release fertility -- landed on a shed in a county that already grows the feedstock. Under the Atthowe ethic the feedstock is plant residue; the plant's sludge is a second stream with its own permit, its own books, and its own gate, read by the city and the state before any contract.

The lift. A vacant shop yard to an industrial net lease plus a pad fee per ton, with the tenant's receivables split among farmers buying amendments the federal program pays for, highway contractors buying compost on the spec, and, if the city's reading allows, a residual services contract. Counsel's planning band for the rent is unsourced; a broker's opinion is the first quote. The type carries the least resale risk of the five, because a fenced metal building on the interstate re-leases to any trade.

The trap. Odour, dust, and a state registration. A compost pad near the city's edge wants the neighbours read before the site, and the state's compost registration and stormwater permit read before the first windrow. And the aerial-application hangar carries a chemical past: ground to be made clean, with a phase-one environmental report as the first document.

```
format property-lift-v1

capital_stack      equity and a small fixed loan on the roof; the
pyrolysis unit on the tenant's books rather than the property's
verifier          the state registration and the certification lab;
a weigh ticket per load; the ledger
trap              odour and dust; state compost registration and
stormwater permit; a chemical past under the hangar
falsifier          a phase-one report that reads remediation; a state
registration refused; the second season closes with zero contractor
offtake on the spec
```

7. The cold warehouse turned food hub -- the plate's ground

What stands. The town already moves food at scale: a robotics-enhanced retail distribution center, and one of the largest cornmeal plants in North America, employing about 300 and making four fifths of a national chain's cornmeal (city, 2026-02). The school district serves 3,846 students on eight campuses, 82.1% of them economically disadvantaged (state data, 2026), which is a public plate the size of the town. A regional hospital and a university with dining halls stand beside it. Counsel found zero cold-storage buildings for sale on the dated lists; the type is read by role, and the first

document is a broker's search for an older cold or dry distribution building near the rail line.

The tenant. The hub: aggregation, washing, cold chain, and a kitchen for ecological produce, pulses, and grain from the county's growers, sold first to the school district, the hospital, and the university. Hemp grain and the cooperative's organic cottonseed oil belong in the same building.

The lift. A tired warehouse to a net lease with refrigeration the tenant owns. The public receivable is procurement rather than a grant: farm-to-school and local-food preference programs reward pounds delivered from named farms. Counsel reads it plainly: federal local-food purchasing money for schools and food banks was cut in 2025 (federal agency, 2025), so the durable receivable is the district's own food-service budget and the state's preference, a smaller and steadier number than the federal one was.

The trap. Refrigeration is the tenant's cost and the property's liability if the tenant leaves; the lease has to say who owns the compressors. And a food business is the youngest of the five, which is why it reads fifth.

```
format property-lift-v1
type                cold warehouse turned food hub
example            an older cold or dry distribution building near
the rail line or the interstate -- a listing gap, read by role
price_today        a named gap; a broker's search is the first
document
tenant            the food hub -- aggregation, cold chain, and a
kitchen for ecological produce and grain, feeding public plates
public_receivable  school-meal procurement (a district of 3,846
students, 82% economically disadvantaged, 2026); state local-food
preference; hospital and university dining contracts
noi_lever          tired warehouse -> net lease with tenant-owned
refrigeration
capital_stack      equity and a small fixed loan; a federal rural
business guarantee on the tenant's cold chain
verifier           delivery tickets per school; the district's
purchasing records; the ledger
trap              compressors and who owns them; a young tenant;
federal local-food purchasing cut in 2025
falsifier          the first season closes with zero purchasing
letters from the district or the hospital; a phase-one report on an old
cold building's refrigerant and insulation
```

8. Why the five sit in this order

The yard leads because it costs least to prove: USD 175,000 buys a roof over 50,000 square feet, the first tenant is a baler who exists today, and the receipt the works study wants at the plant is the same receipt the bale carries. The acres are second because the reuse lease is the works study's second lap and the water receipt is the lift itself. Downtown is third because the public capital is standing and dated and the town's own precedent proves the conversion, and it is third rather than first because a market hall is a tenant to be grown while a baler is a tenant to be hired. The fertility works is fourth because it is the thread from the materials studies with the strongest public specification behind it, and fourth rather than higher because its permits are the slowest of the five. The food hub is fifth because its property is a gap and its federal money shrank in 2025, and it stays on the list because the plate is the largest public buyer in the county and the ethic's whole point.

Read as one lap under Simple, Lovable, Complete: **Simple** is the yard on a net lease.

Lovable is the market hall downtown with the plant's reading on the wall. **Complete** is the bale from the reuse acres, stored in the yard, its residue composted at the works, and its story sold at the market -- five roofs, one ledger.

9. Projections

The seed-and-grain yard reads an eleven percent unlevered lift within eighteen months of purchase. Horizon: eighteen months from closing. Assumptions: an all-in cost at or under USD 525,000; a fibre operator signs a net lease near USD 50,000 a year with an offtake letter behind it; the local cap rate reads at or under 9.5%. Falsifier: a broker's rent opinion under USD 0.75 per square foot per year, or an appraisal at a cap above 10%. Confidence: plausible.

A reuse-water lease on acres beside the plant is signed by the 2027 planting. Horizon: spring 2027. Assumptions: the plant's permit leaves acre-feet to lease after the city's own site; the city authorizes a Type II use for a non-food crop; a grower and a syndicate hold one parcel between them. Falsifier: the permit reading that sends the whole return to the city's own site. Confidence: plausible.

A downtown building reaches the equity target on a rent below the yard's, because the credits and the grant cut the basis. Horizon: thirty months from purchase, after the

audited cost report. Assumptions: the building is contributing on the district map; the TIRZ fund holds; the credits sell at a discount under a fifth. Falsifier: a non-contributing reading, or a TIRZ fund that closes before the grant. Confidence: a live possibility.

The fertility works holds a highway-department compost contract within two seasons of registration. Horizon: two growing seasons from the state registration. Assumptions: the pad clears the registration and the stormwater permit; the product passes the testing-assurance certification; a district contractor buys on the spec. Falsifier: the second season closes with zero contractor offtake. Confidence: a live possibility.

The food hub's public plate is the school district before it is any federal program. Horizon: the 2027-28 school year. Assumptions: the district's food service writes a purchasing letter; the hub delivers a season with the cold chain holding. Falsifier: the 2027 planting arrives with the letter still unwritten. Confidence: a live possibility.

10. Base rates, before the story

Most value-add syndications earn their lift from occupancy and rent on a property class the market already prices, over the five to seven years a sponsor usually states; a lift proven inside two years is the departure this page argues for, and the argument rests on the public capital stack downtown and on tenants whose first customer already exists. Most first mills in a young fibre industry run below nameplate for two seasons and close for want of straw or buyers rather than machines (Kansas City study). The country harvested about 3,200 pounds of fibre hemp per acre on average in 2024 against extension budgets near 6,500 (same study). Small-town industrial buildings re-lease slowly; homes in Hale County stay on the market a median of 94 days (listing aggregator, 2026), and commercial days-on-market is a named gap. About half of Texas historic-credit projects since 2015 used both credits, which says the pairing is ordinary rather than novel (state commission). And most downtown grant programs forfeit the grant when work starts before the notice to proceed, which is the base rate of an eager sponsor.

11. Structural and cyclical, sorted

Structural: the plant's outfall and land-application permit; the county seat, the charter, and the TIRZ ordinance; the National Register district; the interstate and its expansion designation; the rail main line; the organic cotton cooperative down the interstate; the university's trial plots; the state highway department's compost specification; the state's

historic credit in statute since 2013. Cyclical: the cap rate; the drought stage and the reservoir; the federal hemp definition's effective date (2026-11-12, delay pending); the TIRZ fund's balance; federal conservation appropriations; the district's food budget; the price of hurd, bast, and compost in any given season.

What this refuses, and the named gaps

It seats nothing. The five types and their order are counsel's lean, and the maintainer's word seats them. **It picks zero parcels and zero sponsors.** The listings are dated examples of a type, and any one of them is chosen on an appraisal and a condition report from people with no stake. **It moves nothing.** Every dollar waits behind the sleeve's gates, in order: securities counsel, the fee-only fiduciary, the public-benefit charter, entity separation, the word. **It carries no household numbers. It holds housing outside the count.** The city says housing is its main priority, over half of its workers live outside its limits, and its own precedent converted a hotel into lofts (city, 2026-02); a motel or extended-stay on the interstate converted to monthly lofts for the mill hands and the growers is the sleeve's standing housing line, and it stands outside the five because its tenant is a household rather than an Atthowe works. **It parks the meatpacking site.** The largest industrial parcel in the county's story is ground to be made clean rather than ground to be bought; its owner and use are a gap, and whether the fund's hand ever belongs there is the maintainer's word behind the charter.

Twelve gaps are named rather than filled: current asking prices and days-on-market for Plainview commercial property; a local broker's cap-rate and rent opinions for older industrial and downtown space; whether the US 70 restriction's word *fertilizer* reaches biochar and compost under the state agriculture code; the acres and acre-feet of the plant's land-application site and what is left to lease; the county's irrigated-versus-dryland cash rent spread; whether any Plainview tract carries an opportunity-zone designation under the 2025 tax law's new round; whether Hale County has adopted the state's commercial property-assessed clean energy program for water and energy retrofits; the state highway department's current compost item edition and whether any hemp-fibre blanket holds an approved-products listing; the district map's contributing status for any candidate building; the city's edge-of-town rules for a compost pad; the school district's current local-food purchasing; and whether a phase-one report exists for the aerial-application site.

Gratitude

Helen Atthowe taught the ethic this page grows under, plant-raised fertility on a farm that feeds itself, and the tree carries her name on it with thanks. The works town study taught the order of laps this page rides. The investing community whose founder teaches the four-quarter portfolio taught the sleeve reading, and is thanked by name in the field memo where that thanks belongs. The city of Plainview taught its own numbers by publishing them, and the developers of the old hotel taught, by doing it, that a worn building downtown can come back as a valuable piece of property. The extension agronomists at Lubbock and Plainview taught what hemp does on an inch a week. Nothing of theirs is reproduced here.

Next: two quotes and one map before any parcel -- a broker's rent and cap opinion for older industrial and downtown space, a title company's reading of the US 70 restriction, and the district map with contributing buildings marked -- then the yard's owner, the plant's operator, and the cooperative's gin manager at one table.
