

The Loan Beside the Portfolio -- borrowing against Siya's public sleeve to fund the other three, read by what each hand rewards

Stamp: STAMP -- to be taken from the one clock at seating, never typed by counsel

Language: EN

Style: New Gauge, Field setting -- Civic (name what the reward measures) and TAME (bound every claim, say why) carried through (see ../context/GAUGE_STYLE.md)

Voice: Kyri

Status: Mixed -- design. A reading of a plan Keaton stated, with dated rate readings and counsel's own arithmetic. Nothing here is investment, legal, or tax advice; nothing seats; every money move waits behind the sleeve's gates and behind the licensed team Keaton named, including the tax attorney the investing community recommends. Counsel holds no license and no stake

Field only: this memo names the fund, the family, and household numbers; the seed projector withholds it by construction, which is the intended disposition

Basis: the elder counsel session on securities-backed lending (20260810 , the Siya field guide); the fiber sleeve and works town sleeve memos already seated; a broker's published pledged-asset-line rate page dated 2026-08-24; a discount broker's published margin table read 2026-08-27; the New York Fed's overnight rate for 2026-08-25; a retail app's own account-type pages; two rate aggregators dated April and May 2026, used for ranges only and marked as such

Kin: [the fiber sleeve](#) - [the works town sleeve](#) - [five properties for Atthowe works in Plainview](#) - [Civic Style](#) - [the Silo Technique](#)

The reading, first

Borrow against the portfolio rather than sell it, at a shallow depth, from whichever lender prices closest to the benchmark, and put the proceeds where each sleeve's reward is legible. That is the plan Keaton stated, and it holds under today's numbers with one correction to the rule of thumb behind it. The rule compares a loan's yearly interest rate against a one-time capital gains rate, and those two numbers are different kinds of thing. The honest test is simpler and stricter: **borrowing beats selling in any stretch where the kept stock earns more than the loan costs, and the tax saved is the cushion for the stretches where it does not.** At

today's rates that cushion is real and modest, and it becomes permanent only if the shares are held to a stepped-up basis, which is an estate question for the tax attorney.

Read that way, the numbers say this. The overnight benchmark every lender prices from stood at **3.66% on 2026-08-25** (New York Fed). The cheapest published rate a USD 600,000 draw can reach today is about **4.7%** at a discount broker's margin desk, and the incumbent's own line typically prices between about **5.2% and 6.7%** depending on the spread negotiated. Selling USD 600,000 of stock instead costs a one-time federal tax of roughly **6% to 18% of the proceeds**, depending on the shares' cost basis, and a further **13.3%** for any member whose California residency is still in question for the year of the sale. So a shallow line priced near the benchmark is the lower-cost door, and the door stays safe at a draw of **USD 500,000 to 625,000 against USD 2.5 million**, which is 20% to 25% and leaves room for a market fall of half before any lender asks for money.

Counsel's lean, held until Keaton's word and the licensed team's reading: **one line, drawn in three named tranches, at the incumbent if it will price at the benchmark plus 2.0% or better with a written yes on private placements, and at the discount broker's margin desk if it will not.** The three tranches are the USD 100,000 check into DJINN's venture, repaid from monthly income inside ninety days; USD 375,000 across two or three real estate syndications of the Brazos kind, carried until each property distributes or exits; and USD 125,000 held for a private-business stake, drawn only when a named deal reaches its own gates. The sixth section says why the stock will still be about four fifths of what Siya holds afterward, and why that is arithmetic rather than a failure of the plan.

1. What the rule of thumb measures, and the honest test

A loan's rate is paid every year the loan is open. A capital gains tax is paid once, on the gain rather than on the whole sale. Setting a 5% rate beside a 23.8% rate reads as a comparison and is a category mistake, the way comparing a monthly rent to a purchase price would be. Civic Style asks what each number rewards, and the two reward different things: the loan rate rewards the lender for time, and the tax rewards the government for a realized gain.

So the test that survives the arithmetic has three parts.

Return over rate. In any year, keeping USD 600,000 of stock earns whatever the stock earns, and the loan costs its rate. At a 4.7% loan, the stock has to earn about 4.7% for the two to cancel; at a 6.6% loan, about 6.6%. The long-run nominal return on broad US stocks has run near 7% to 10% a year over most long windows, which is why the strategy works on average and stumbles in flat years.

The tax as cushion. Selling costs the tax once, on the gain only. Paying it later rather than now is worth roughly the return the tax dollars earn in the meantime, and on a five-year horizon that lowers the break-even stock return by about half a percentage point. Section 4 measures it. The cushion is real. It is also small next to the return-over-rate term, which is the part of the rule of thumb the family should hold onto.

The step-up. Federal law resets the basis of inherited shares to their value at death, so a gain deferred for a lifetime is never taxed at all. That is the mechanism behind the borrow-rather-than-sell habit of families with large embedded gains, and it turns the cushion from a deferral into an avoidance. Whether it applies here depends on who holds the shares, in what vehicle, and how the family's estate plan reads, and that is the tax attorney's question rather than counsel's.

2. The rates today, dated

Every lender here prices as the overnight benchmark plus a spread, and the spread is where the whole decision lives. The table reads each lender's published or reported spread for a draw of about USD 600,000 against a USD 2.5 million collateral pool. A figure marked *aggregator* comes from a comparison site rather than the lender, and stands until a written quote replaces it.

Lender and instrument	All-in today on a USD 600,000 draw	Entity borrower	Use of proceeds	Source and date
-----------------------	------------------------------------	-----------------	-----------------	-----------------

Lender and instrument	All-in today on a USD 600,000 draw	Entity borrower	Use of proceeds	Source and date
Discount broker, margin loan (the broker's Pro plan)	4.71% blended: 5.13% on the first USD 100,000, 4.63% on the next USD 900,000, 4.38% above USD 1 million; benchmark + 1.5%, 1.0%, 0.75%	yes; organization accounts are a standard type	cash may be withdrawn against margin excess for any use; the broker liquidates automatically when equity falls under its maintenance line	the broker's rate table, read 2026-08-27
Retail app, margin loan	4.50% flat for balances USD 100,000 to 1 million; 5.00% under USD 50,000; 3.95% above USD 50 million	no -- the app's own pages list individual, joint, IRA, and managed accounts only	withdrawal of margin as cash to be confirmed in writing; no advisor, no negotiation	rate table reported July 2026 (secondary); account types from the app's support pages
Second-largest discount broker, pledged asset line (a bank line)	6.56% for an organization borrower: benchmark + 2.90% at a collateral loan value of USD 1 million to 2.5 million; 6.06% for an individual or trust borrower with USD 1 million to 5 million of qualifying assets (a 0.50% relationship discount organizations are excluded from)	yes, by phone rather than online; organizations lose the relationship discount	a non-purpose line: proceeds may not be used to purchase securities, pay down margin, or land in a brokerage account (the bank's own words)	the bank's published rate page, benchmark as of 2026-08-24

Lender and instrument	All-in today on a USD 600,000 draw	Entity borrower	Use of proceeds	Source and date
The incumbent wirehouse, liquidity access line (a bank line through the advisor)	5.2% to 6.7%: benchmark + 1.5% to 3.0%, negotiated on relationship and size; fixed-rate advances also offered	yes; entity borrowers are ordinary here	a non-purpose line; the elder facility letter reads <i>cannot be used to purchase, carry or trade securities</i>	aggregator range, May 2026; facility language from a public filing (2010)
An investment bank's securities line	5.0% to 6.7%: benchmark + 1.30% to 3.00%, tightest at USD 5 million and above	yes	non-purpose	aggregator, May 2026
Other wirehouse and private-bank lines (four read)	5.1% to 7.5%: benchmark + 1.40% to 3.85%, with 0.25% to 0.50% relationship discounts on request	yes	non-purpose	aggregator, May 2026

Three readings fall out of the table.

The discount is real and is about two percentage points. Against a USD 600,000 draw, the gap between the discount broker's 4.71% and the incumbent's rack rate near 6.7% is about **USD 12,000 a year**, and against the second discount broker's organization rate it is about USD 11,000. Over a five-year syndication hold that is USD 55,000 to 60,000, which is the size of a whole angel check.

The discount is paid for in three currencies. First, a margin loan is regulated purpose credit with automatic liquidation: the discount broker sells positions the moment an account crosses its maintenance line, with no phone call first, and the retail app's terms read the same way. A bank line calls first and gives days. Second, the discount brokers negotiate nothing; the pricing is a table. Third, the retail app has no account type an LLC can open, which removes it from this particular decision however good its rate is.

The bank lines carry a use restriction that reaches this plan. Federal margin rules restrict a non-purpose loan from buying *margin stock*, meaning listed shares and most funds. The banks' own contracts read wider: *securities*. A share of a private company is a security, and so is a limited partner interest in a Regulation D real estate syndication. So the written question from the elder session stands, and it now has two parts: *does this line permit proceeds to fund a private company's stock, and a limited partner interest in a private real estate offering?* A yes in writing keeps the incumbent in the running for every tranche. A no routes those two tranches to the margin desk and leaves the bank line for household, tax, and cash uses.

3. Selling instead, priced

Selling USD 600,000 of the portfolio realizes a gain equal to the sale less the shares' cost basis, and counsel has never seen the basis. The three cases below bracket it. Federal rates for 2026: the 20% long-term rate begins above USD 545,500 of taxable income for a single filer and USD 613,700 for a joint filer, with 15% below; the 3.8% net investment income tax applies above USD 200,000 and USD 250,000 respectively. At the family's stated income of roughly USD 70,000 a month, most of a large gain would meet the higher rate. Nevada adds nothing.

Basis as a share of value	Gain realized	Federal tax at 15% + 3.8%	Federal tax at 20% + 3.8%	Same, plus California 13.3%
25% (old shares, large gain)	USD 450,000	USD 84,600 (14.1% of proceeds)	USD 107,100 (17.8%)	USD 166,950 (27.8%)
50%	USD 300,000	USD 56,400 (9.4%)	USD 71,400 (11.9%)	USD 111,300 (18.6%)
75% (recent shares, small gain)	USD 150,000	USD 28,200 (4.7%)	USD 35,700 (5.9%)	USD 55,650 (9.3%)

The California column is the reason 2026 is a borrowing year rather than a selling year. Sara's Nevada residency dates from 2026-06-29. A gain realized in 2026 sits in a year California can still examine, and a part-year residency reading is exactly the kind of question that state answers slowly and expensively. Borrowing defers the realization into a year where the residency is settled. This is a timing point rather than a tax opinion, and the tax attorney reads it.

A third path sits between borrowing and selling. Shares carry their basis lot by lot. Lots bought recently at prices near today's carry almost no gain, and selling those costs almost nothing in tax. A lot-level basis report from the custodian would show whether some of the USD 600,000

can be raised at a 1% to 3% tax cost, which beats any loan rate outright. Counsel names this as the first document to pull, before any lender is called.

4. The five-year comparison

The table charges the deferred tax honestly: at the end of five years everything is sold and every gain is taxed at 23.8%, so the borrow path pays its tax late rather than never. Alternatives earn 8% a year in every case, chosen as a plain assumption for a syndication with a preferred return; the stock's return varies down the columns; the entry is the borrow path's advantage over the sell path in thousands of dollars.

Loan rate and basis case	Stock 0%	Stock 5%	Stock 7%	Stock 9%	Break-even stock return
4.7% loan, basis 25%	-103	+24	+81	+144	4.1%
4.7% loan, basis 50%	-115	+11	+69	+131	4.6%
4.7% loan, basis 75%	-128	-2	+56	+118	5.1%
5.66% loan (benchmark + 2.0%), basis 50%	-144	-18	+40	+102	5.6%
6.56% loan (organization rate at a bank line), basis 50%	-171	-45	+13	+75	6.6%

Three things the table teaches.

The break-even is the loan rate, give or take half a point. Deferral buys about 0.5% of cushion at five years; basis moves the break-even by a further half point either way. So the rule of thumb reduces to *expect the stock to beat the loan*, and the cheaper the loan, the lower the bar. Moving from 6.56% to 4.71% lowers the bar by nearly two points, which is the whole case for shopping the spread.

Held to a step-up, the cushion becomes permanent. If the shares are never sold, the same 50%-basis, 4.7% case reads **+130,000 at 5%** and **+205,000 at 7%**, and the break-even stock return falls to about 1%. That is the version of the strategy the estate plan can earn, and the tax attorney says whether it can.

Deductible interest lowers the bar further. Interest traced to an investment use is deductible against net investment income under the investment-interest rules, and interest traced to a passive activity is deductible against passive income. At a 37% marginal rate, a 4.71% loan reads near 3.0% after tax and a 6.56% loan near 4.1%. The tracing rules follow the dollars, so

each tranche wants its own draw, its own receiving account, and its own line in Dimeroll from the first day. Whether the family's USD 70,000 a month counts as investment income or passive income for these rules depends on what it is, and that is a named gap below.

5. Size, and the distance to a call

A securities line is a demand loan. The lender can ask for money whenever the collateral's loan value falls under the balance, and can change advance rates and eligible collateral at its discretion. So the size question is a safety question first, in TAME order: name the bound, say why, and prove it from both sides.

Draw	Loan-to-value	Portfolio value at which a bank line calls (advance rate 50% / 65% / 70%)	Fall from USD 2.5 million	Value at which a margin desk liquidates (maintenance 25% / 30%)	Fall
USD 500,000	20%	USD 1.00 / 0.77 / 0.71 million	60% / 69% / 71%	USD 0.67 / 0.71 million	73% / 71%
USD 600,000	24%	USD 1.20 / 0.92 / 0.86 million	52% / 63% / 66%	USD 0.80 / 0.86 million	68% / 66%
USD 625,000	25%	USD 1.25 / 0.96 / 0.89 million	50% / 62% / 64%	USD 0.83 / 0.89 million	67% / 64%
USD 750,000	30%	USD 1.50 / 1.15 / 1.07 million	40% / 54% / 57%	USD 1.00 / 1.07 million	60% / 57%
USD 1,000,000	40%	USD 2.00 / 1.54 / 1.43 million	20% / 38% / 43%	USD 1.33 / 1.43 million	47% / 43%

The worst fall in living memory for a broad US stock index ran to about 57% from peak to trough (2007 to 2009), and 34% in five weeks (2020). A draw at 25% survives the first with room on a diversified pool at the usual advance rates. A draw at 40% survives neither on the conservative row. Two cautions narrow the table further. A concentrated pool of a few names carries lower advance rates than a diversified one, sometimes half, and the composition of the USD 2.5

million is a named gap. And lenders lower advance rates during the very falls that matter, so the conservative column is the one to plan against.

Counsel's proposed bound, then: **an opening draw at or under 25%, a standing ceiling of 30% that any tranche must fit under, and a call plan written before the first draw.** The call plan names the responders in order. The first is monthly income, which at USD 70,000 covers a USD 600,000 line in about nine months and can retire a tranche in weeks. The second is the highest-basis lots, sold first because they cost least. The third is the syndication distributions as they arrive. A green here is a line that never crosses 30% in any month; the red that proves the guard is real is a modeled 50% fall that would push a 30% line to 60%, which is above the conservative call line, and which is why the ceiling is 30% rather than 40%.

6. What the allocation arithmetic allows

The four-quarter reading the investing community teaches puts about 30% in public markets, 30% in real estate, 20% in venture, and 20% in private business. Keaton has already read that Siya's public sleeve will sit above 30% for a long time, and the arithmetic says how far above.

With USD 600,000 borrowed and deployed, Siya holds USD 2.5 million of stock and USD 600,000 of alternatives against USD 600,000 of debt: **USD 3.1 million gross, USD 2.5 million net.** The stock is **80.6% of gross assets** and the three other sleeves together are **19.4%**. To bring the public sleeve to 30% of gross by borrowing alone, the family would have to borrow **USD 5.83 million against USD 2.5 million**, a loan-to-value of 233%, which no lender offers and no safety bound survives. So the four-quarter shape is a destination that new income, distributions, and future capital walk toward over years. Leverage moves the first step and only the first step. That is the correct reading rather than a disappointing one: a household that reached 30/30/20/20 in a single year by borrowing would have a collateral pool one market fall away from a forced sale.

Two paths do move the shape faster, and both are gated. Monthly income of USD 70,000 directed to the three private sleeves is USD 840,000 a year, which by itself lifts the alternatives to about a third of gross assets inside three years with no added debt. And selling the lowest-gain lots, as section 3 names, converts stock to alternatives at a tax cost near zero. Between the two, the loan's job is narrow: it moves money on the day a deal closes, and income and distributions retire it afterward.

7. One loan, two, or three

Keaton asked about one to three loans. Read by what each adds:

One line, three tranches. One contract, one collateral pool, one rate, and three named draws that each land in their own receiving account with their own ledger line. This gives the tracing rules what they need and the family one statement to read. Counsel's lean, because it is the simplest thing that is complete.

Two lenders. The collateral splits: part of the portfolio moves in kind to the discount broker for the margin loan that can fund the private placements at 4.7%, and the rest stays at the incumbent for a bank line that calls first and prices on relationship. The transfer is a custodian-to-custodian move of shares, taxed at nothing, at a fee the elder session read near USD 100. The cost is two statements, two maintenance regimes, and a thinner pool behind each line. Reach for this only if the incumbent holds above the benchmark plus 2.5% or answers no on the private-placement question in writing.

A third, fixed-rate tranche. The incumbent's line offers fixed-rate advances beside the floating one. A syndication with a five-to-seven-year hold is a long draw, and a fixed tranche matched to it removes the one risk the family does not control, which is the benchmark rising. The price of that insurance is usually a quarter to half a point over the floating rate. Worth a quote once the first syndication has a closing date, and worth nothing before.

The negotiation itself is short. Take the discount broker's published 4.71% to the incumbent's advisor as the benchmark quote, ask for the line at the overnight rate plus 2.0% or better, ask for the relationship discount by name, and ask the private-placement question in writing. A yes at or under plus 2.0% keeps the whole plan under one roof. Anything above plus 2.5% is the two-lender case.

8. Where the USD 600,000 goes, and what each hand rewards

Civic Style reads a portfolio the way it reads a policy: name the outcome, name what the reward measures, keep the two aligned. Each tranche below rewards something different on purpose, and each carries its own verifier, its own tax lane, and its own gate.

Tranche	Amount	Instrument and repayment	What its reward measures	Verifier	Tax lane (tax attorney reads)	Gate before the draw
---------	--------	--------------------------	--------------------------	----------	-------------------------------	----------------------

Tranche	Amount	Instrument and repayment	What its reward measures	Verifier	Tax lane (tax attorney reads)	Gate before the draw
venture: DJINN's venture	USD 100,000 (4% of the portfolio, inside the field guide's 5% single-company law)	equity in a small C corporation, as the elder session leaned, so the qualified-small-business exclusion can attach; drawn as a bridge and repaid from income inside ninety days	a few large outcomes over many years; the receipt is the cap table	the company's counsel and the family's securities counsel; the cap table itself	investment interest on the bridge, small because the bridge is short	the entity, the instrument, and the paper the elder session named; DJINN's own lawyer at the table

Tranche	Amount	Instrument and repayment	What its reward measures	Verifier	Tax lane (tax attorney reads)	Gate before the draw
real estate: two or three syndications	USD 375,000, in checks of USD 125,000 to 190,000, each under 8% of the portfolio	limited partner interests, carried until distributions or exit; retire a tenth of the tranche each year from income so the line is gone inside ten years at the latest	cash yield and preservation, the sponsor's promote, the tenant's receivables - - the works town sleeve's reading	an appraiser with no stake; the sponsor's audited record; the property's own ledger in Dimeroll	passive- activity interest against passive income; the syndication's own depreciation flows through	securities counsel on the offering; the fiduciary's investment policy statement; a sponsor with its own money in the deal; debt at the property modest and fixed, because a levered property bought with a margin loan is leverage on leverage and the sleeve memo already asks for boring

Tranche	Amount	Instrument and repayment	What its reward measures	Verifier	Tax lane (tax attorney reads)	Gate before the draw
private business	USD 125,000, held undrawn until a named deal	a stake in an operating company, the fiber operator or its kin, drawn only when a first season of books can be read	earnings and control	the operator's books, one set, in Dimeroll	depends on the entity form; often investment interest, sometimes business interest	the three quotes and one afternoon the corridor studies name; Keaton's word

Read down the fourth column and the alignment shows. The venture check is rewarded by the cap table, the syndication by the lease and the appraisal, the operator by its earnings, and the public sleeve by daily price and dividends. The loan sits beside all four and is rewarded by none of them; its only job is to be cheap, shallow, and retired on schedule. A household ledger that shows each tranche's interest beside the sleeve it funded is the glass surface a co-limited-partner, a lender, and the tax attorney can each read, and it is the same surface the sleeve memos already ask Dimeroll to keep.

9. Projections

The incumbent prices the line at the benchmark plus 2.0% or better once shown the 4.71% quote. Horizon: thirty days from the first written ask. Assumptions: a USD 2.5 million relationship carries the discretion the aggregators describe; the advisor is measured on retaining assets. Falsifier: a written quote above the benchmark plus 2.5% after the relationship discount is asked for by name. Confidence: plausible.

A shallow line at 25% or under carries through the next 50% fall without a call. Horizon: the life of the line. Assumptions: the collateral is diversified and advance rates hold near 65%; the lender lowers advance rates by no more than a fifth during the fall. Falsifier: a lender letter cutting the pool's loan value under the balance at any point above a 50% fall, or a concentration reading that sets advance rates near 40%. Confidence: likely for a diversified pool; a live possibility for a concentrated one.

The stock beats the loan over the first five years. Horizon: five years from the first draw. Assumptions: a diversified US equity pool returns at or above 5% a year on average; the loan

floats at or under 5% for the period. Falsifier: two consecutive calendar years with the pool's return under the loan rate while the line stays drawn, which is the trigger to retire the line from income rather than to argue with it. Confidence: plausible.

The DJINN tranche is repaid inside ninety days of the draw. Horizon: ninety days.

Assumptions: income holds near USD 70,000 a month; the check goes out as a single draw.

Falsifier: the tranche still on the statement at day ninety-one. Confidence: likely.

The public sleeve is still above 60% of gross assets three years out. Horizon: three years.

Assumptions: USD 840,000 a year of income flows to the private sleeves and the stock returns

5% to 9%. Falsifier: a lot-level basis report showing that a third of the portfolio can be sold at a tax cost under 3%, which would move the shape faster than any of this. Confidence: likely.

10. Base rates, before the story

Most securities-backed borrowing is used for taxes, real estate, and business needs at loan-to-values under a third, and the market is more than USD 200 billion across major broker-dealers (aggregator, May 2026); the borrowers who were sold out in 2008 and in March 2020 were overwhelmingly the ones above 40% against concentrated pools. Broad US stocks have returned near 7% to 10% a year nominal over most long windows and have delivered flat-to-negative five-year stretches roughly one decade in five. Real estate syndications usually state five-to-seven-year holds and preferred returns of 6% to 8%, and a meaningful share of 2021-vintage deals with floating-rate debt made capital calls or lost limited-partner equity in 2023 and 2024, which is counsel's knowledge and unfetched this session. Angel checks lose money more often than they make it; a classic study of angel returns found about half of exits returned less than the money in, with the average carried by a few large outcomes, which is the shape the venture sleeve is sized for. And most families who borrow rather than sell do so with an estate plan in view, because the step-up is where the deferral becomes a saving.

11. Structural and cyclical, sorted

Structural: the one-time nature of a capital gains tax against the yearly nature of interest; the stepped-up basis at death; Nevada's constitutional bar on a personal income tax; the federal margin rules that shape non-purpose lines; the investment-interest and passive-activity tracing rules; the demand nature of every securities line; the retail app's account types. Cyclical: the overnight benchmark at 3.66% and the policy rate behind it; every lender's spread; advance rates, which fall in the falls; cap rates and preferred returns in the syndication market; the incumbent's appetite to retain a USD 2.5 million relationship this quarter; California's reach into a 2026 sale.

What this refuses, and the named gaps

It picks no lender. The table ranks by published rate; the written quotes rank the decision, and the incumbent's quote has not been asked for. **It moves nothing.** Every dollar waits behind the sleeve's gates, in order: securities counsel, the fee-only fiduciary and the investment policy statement, the public-benefit charter, entity separation in Dimeroll, Keaton's word. **It gives no tax opinion.** The rates, brackets, and tracing rules are stated as counsel read them and are the tax attorney's to confirm. **It names DJINN's venture and the Brazos-type properties as the destinations Keaton stated,** and picks no deal, no sponsor, and no parcel.

Twelve gaps are named rather than filled: the lot-level cost basis of the USD 2.5 million, which decides section 3 and may replace section 4; whether the custodial account is titled to Siya Fund LLC or to Sara or Keaton individually, which decides the borrower, the relationship discount, and the contribution's tax treatment; the composition of the pool, diversified or concentrated, which decides advance rates and the call table; the incumbent's current advisory fee, which the elder session read near 1% and which outweighs any spread; the incumbent's current line agreement's use-of-proceeds language, read by securities counsel; the retail app's written rule on withdrawing margin as cash; the incumbent's fixed-rate advance pricing; the nature of the USD 70,000 a month, which decides whether it is investment income or passive income under the tracing rules; each member's state-residency picture for the year of any sale; whether Siya today is the Nevada LLC the elder session chose or the Wyoming public-benefit entity the sleeve memos name, since the two answer the borrower question differently; the fiduciary's investment policy statement, which owns the sleeve percentages and the position-size law; and the investing community's own deal terms, which this memo has not read.

For the licensed team, in order

1. **The tax attorney.** The step-up reading for the family's estate plan; the tracing of each tranche's interest; whether the monthly income is investment or passive income; the California picture for any 2026 sale; the entity's form and the contribution of appreciated shares to it.
2. **Securities counsel.** The line agreement's use-of-proceeds clause against a private C-corporation stock purchase and a Regulation D limited partner interest; the offering documents of any syndication; the three-hats papering if a musician on the roster is also a limited partner.
3. **The fee-only fiduciary.** The investment policy statement's bands, the position-size law for real estate, the concentration of the pool, and the call plan.
4. **The custodian's advisor.** The lot-level basis report first; then the written quote at the benchmark plus 2.0%, the relationship discount by name, the private-placement answer in

writing, and a fixed-rate advance quote when a closing date exists.

Gratitude

The four-quarter reading is siloed from Braiden Shaw and the Growth Circle community he founded, thanked here by name in the field where that thanks belongs, and again on the day the family joins their first call. DJINN taught this tree's first rule, *don't be too smart about it*, and this memo tried to keep it. The elder counsel session of 20260810 taught the bridge pattern, the 25% rail, and the written question, and this memo grows from that core rather than replacing it. The brokers and the New York Fed taught their own numbers by publishing them. Nothing of theirs is reproduced here.

Next: pull the lot-level basis report and the account title from the custodian before any lender is called; ask the incumbent for the written quote and the written private-placement answer with the 4.71% reading in hand; then carry sections 3, 4, and 8 to the tax attorney the community recommends, and let the fiduciary set the bands before the first draw.
